# CHUBB DATA CABINET MICRO 50

The Chubb Data Cabinet is a proven solution that is available as an extension to any computer network system threatened with the possibility of physical data loss during a fire. The Data Cabinet described in this brochure is one of several types of media protection cabinets built to withstand even the most distressing of fires.

The Chubb Data Cabinet functions as a very secure storage facility against fire for data or media storage products; be it in the form of floppy diskettes, back-up drives, CD-Roms, back-up cartridges, microfiche and etc. The Chubb Data Cabinet described in this brochure is a UL Listed® product that has been tested in compliance to UL 72 Class 125 for fire protection.

Chubb Data Cabinets tested in compliance to UL 72 Class 125 represent one of the highest and most stringent test currently used to evaluate media protection equipment by one of the world's leading independent testing agencies. Cabinets that are subject to testing by UL undergo a series of tests designed to replicate the effects of a very serious fire. Certain sections of testing done may also replicate extraordinary fire situations to accommodate for occasional demands placed on such equipment.

Testing Data Protection Equipment in compliance to UL assures Clients of its reputed protective qualities. It is well proven that burglar-resisting safes and steel filing cabinets are ineffective for protecting media storage equipment as floppy disk manufacturers recommend that disks should not be exposed to temperatures exceeding 52°C.

## TESTING IN COMPLIANCE TO UL 72 CLASS 125

### FIRE ENDURANCE TEST

The objective of this Test is to ensure that the Cabinet has been designed to limit internal temperature to no more than 52°C with a humidity not exceeding 80% after one hour exposure to a severe fire. The most critical area of concern in this Test is often not *during* the fire itself but rather *after* the Test, during the 'furnace soak-out' period.

The 'furnace soak-out' is when the Cabinet is left to remain in a closed furnace after the flames have been put out to replicate an 'after-fire' environment. This Test is conducted to ensure that internal temperatures do not exceed the maximum 52°C after the fire due to external heat slowly radiating into the Cabinet.

At no time during the Test does the UL Test Requirement allow the temperature inside the Cabinet to rise higher than the temperature suitable for diskettes in order to pass the Test successfully.

### FIRE SHOCK TEST (EXPLOSION TEST)

This Test is designed to reveal if the Cabinet is able to withstand sudden exposure to high heat without exploding. The Test requires for a cold cabinet to be pushed into a furnace pre-heated to a temperature of 1090°C (2000°F) to simulate a Cabinet falling into a fire. The furnace exposure continues at this temperature for 30 minutes. If no explosion results, the cabinet is left to remain in a closed furnace until sufficiently cool to be opened.

### IMPACT AND RE-HEAT TEST

This Test requires for a hot cabinet to be dropped from 30ft (9.1m) onto rubble to simulate the effect of a floor collapsing during a fire. The Cabinet is then inverted and returned into the furnace and heated for a further 30 minutes to show that it still provides protection.

After the Impact and Re-heat test, the Cabinet is examined for deformation, rupture of parts or insulation and other evidences of through openings into the interior. The door of the Data Cabinet is forced open only after it has sufficiently cooled from the exposure to fire.

### CONCLUSION

In all the above Tests - the Fire Endurance, Fire Shock and Impact and Re-heat Test, the Chubb Data Cabinet has complied to the requirements of UL 72 Class 125 for Fire Protection. In addition to the various Tests outlined above, UL also reserves the right to inspect the manufacturing facility, components and suppliers that make up the manufacturing process of the Chubb Data Cabinet.

Copies of the UL Test Procedure may be submitted upon request to substantiate the above claims.

- To find out more about what UL is all about, please refer to alternative brochure "A Brief Introduction to UL (Underwriters' Laboratory of America)" or to the UL website at <http://www.ul.com>.

The Cabinet comes equipped with a single pull-out tray.  
Additional trays available as optional accessories.

A maximum of 4 trays may be fitted within the Micro 50.  
Storage capacities listed below.

Cabinet Description	Micro 50
Reference and Dimensions	mm
A External Height	858
B External Width	590
C External Depth	842
D Internal Height	398
E Internal Width	380
F Internal Depth	433
G Capacity	80 litres
H Net Weight	180 kg
I Total depth with door at 90°	1148mm
J Total width with door fully open	1185mm

Media Storage Capacities	Micro 50
Capacities are given as a guide only	
Nb. of Trays	Total Capacity
3.5" Diskettes	3 750"
5.25" Diskettes	2 500"
Microfiche	2 3400
Data Cartridge	4 440
CD Rom	2 180

\*Inclusive of additional units placed at excess space at cabinet base.

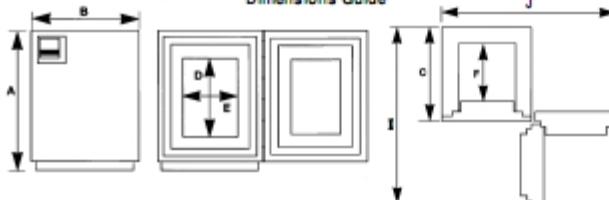

### Locking System

SamAction clw Lock

"This product is classified to UL Standards and requirements by Underwriters Laboratories Inc."

## CHUBB RECORD PROTECTION FILING CABINETS 6000 & 9000 SERIES

*Reliable. Affordable. Fire protection at its best.*

# CHUBB RECORD PROTECTION FILING CABINETS 6000 & 9000 SERIES

Chubb has been at the forefront of fire resistant equipment development and manufacture for more than 180 years. The latest designs in such an equipment category is reflected in its latest 1 hour (6000 Series) and 2 hour (9000 Series) fire resistant Record Protection Filing Cabinets. These cabinets will offer substantial protection to paper-based documents in severe fires while maintaining Chubb's position as one of the most reliable fire protection equipment manufacturers in the world.

The Chubb RPP Cabinet described in this brochure is a UL Classified product that has been tested in compliance to UL 72 Class 350 for fire protection.

Chubb RPP Cabinets tested in compliance to UL 72 Class 350 represent one of the highest and most stringent test currently used to evaluate record (document papers) protection equipment by one of the world's leading independent testing agencies. Cabinets that are subject to testing by UL undergo a series of tests designed to replicate the effects of a very serious fire. Certain sections of testing done may also replicate extraordinary fire situations to accommodate for occasional demands placed on such equipment.

Testing Record Protection Equipment in compliance to UL assures Clients of its reputed protective qualities. It is well proven that burglar resisting safes and steel filing cabinets are ineffective for protecting documents as it is recommended that paper records should not be exposed to temperature exceeding 177°C.

## SPECIFICATIONS

### General Construction

Each drawer front has an overall thickness of 58mm insulated with Chubb's patented POCO fire resistant material. Protecting materials used are also asbestos-free, providing a reliable formulation that is stable, well sealed and will not deteriorate with age. Reinforcement in critical areas allow the file to survive an impact from a fall.

### Locking

2 options are available using both a UL Listed 3-wheel keyless combination lock and keylocks. Option 1 (Central Locking)

- One 3-wheel keyless combination lock and one keylock on the top drawer giving control to all drawers.

### Option 2 (Individual Locking)

- One 3-wheel keyless combination lock and one keylock on the top drawer giving control to all drawers. In addition, one keylock on each drawer.

### Types of keylock

Chubb 6000 Series (1 - hour fire resistance) - Pin tumbler keylocks

Chubb 9000 Series (2 - hour fire resistance) - 10 disc Chubb A/V Lock on top drawer, pin tumbler keylocks on other drawers. (If it is an individual locking option)

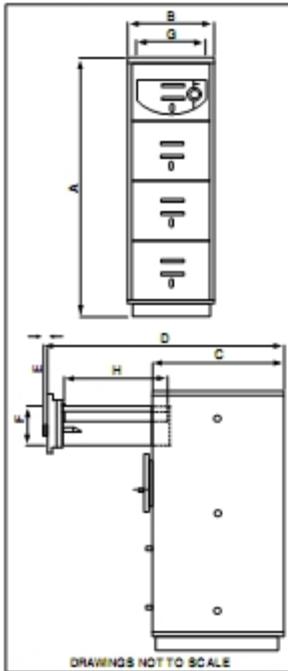

### Drawers

Each drawer is fitted with heavy duty rails and bearings for smooth and lasting operation. No lubrication is required. Each bottom drawer is also fitted with a sprung catch bar for optional individual control.

Each drawer is designed to fit most paper holds and will accommodate most types of box files.

### Rimish

Light grey scratch-resistant epoxy base finish.

DRAWINGS NOT TO SCALE

Note : These products are designed primarily to provide protection against fire and impact for paper documents. For recommended storage of computer-based media, ask for details of Chubb Data Cabinets. For protection against physical attack, ask for details of Chubb Safes.

## TESTING IN COMPLIANCE TO UL 72 CLASS 350

### FIRE ENDURANCE TEST

The objective of this Test is to ensure that the Cabinet has been designed to limit the internal temperature to no more than 177°C after one hour exposure (two hour for 9000 Series) to a severe fire. The most critical area of concern in the Test is often not during the fire itself but rather after the Test, during the 'furnace soak-out' period.

The furnace soak-out is when the Cabinet is left to remain in a closed furnace after the flames have been put out to replicate an after-fire environment. This Test is conducted to ensure that internal temperatures do not exceed the maximum 177°C after the fire due to external heat slowly radiating into the Cabinet.

At no time during the Test does the UL Test Requirement allow the temperature inside the Cabinet to rise higher than the temperature suitable for papers in order to pass the Test successfully.

### FIRE SHOCK/EXPLOSION TEST

This Test is designed to reveal if the Cabinet is able to withstand sudden exposure to high heat without exploding. The Test requires (a) a cold cabinet to be pushed into a furnace pre-heated to a temperature of 1090°C (2000°F) to simulate a Cabinet falling into a fire. The furnace exposure continues at this temperature for 30 minutes. If no explosion results, the cabinet is left to remain in a closed furnace until sufficiently cool to be opened.

### IMPACT AND RE-HEAT TEST

This Test requires (a) a hot cabinet to be dropped from 30ft (9.1m) onto rubble to simulate the effect of a floor collapsing during a fire. The Cabinet is then inverted and returned into the furnace and heated for a further 30 minutes to show that it still provides protection.

### CONCLUSION

In all the above Tests - The Fire Endurance, Fire Shock and Impact and Re-heat Tests, the Chubb RPP Cabinet has complied to the requirements of UL 72 Class 350 for Fire Protection. In addition to the various Tests outlined above, UL also reserves the right to inspect the manufacturing facility, components and suppliers that make up the manufacturing process of the Chubb RPP Cabinets. Copies of the UL Test Procedure may be submitted upon request to substantiate the above claims.
